

Avinash Group ERP

User Guide

For accountants, HR, purchase & sales staff, and administrators
Site: avinas1

Avinash Group ERP — User Guide Overview

Welcome! This guide explains, in plain language, the custom features added on top of ERPNext for the Avinash Group companies (Nepal Gas group and allied businesses). It is written for the people who use the system every day — accountants, HR staff, purchase/sales officers, and administrators.

For developers, the matching technical reference lives in

[../technical/](#).

What's in this guide

Chapter	Who it's for	What it covers
2. Approvals	everyone who submits or approves documents	how the multi-level approval workflow works: submitting, approving, rejecting
3. Attendance & HR	HR staff	biometric devices, check-ins, fixing attendance, allowances, HR reports
4. Buying, Selling & VAT	accounts, purchase & sales staff	the VAT 13% / 0% / Amount scheme, excise, TDS, warehouses, voucher numbers, vehicles, cheque bounce
5. CBMS / IRD e-Billing	accounts staff	how invoices are reported to IRD automatically and what to do when something fails
6. Document Generator	accounts & admin staff	producing balance-confirmation letters and other formal documents
7. Reports	accounts, sales, HR, management	every custom report: what it shows and how to use it
8. Administrator Setup	System Managers	fiscal-year access, company filters, audit trail, devices, templates — all setup checklists

The big ideas (read this once)

Everything is company-scoped. The group runs several companies in one system. Master records (customers, suppliers, items) carry a Company, and the system automatically limits dropdowns to the document's company and blocks cross-company mistakes. If a value you expect is missing from a dropdown, check the Company field first.

Nepali dates everywhere. Transactions store the English (AD) date, but show and filter by the Nepali (BS) "Miti" too. Reports have BS month pickers; attendance and payroll run on BS months; letters print BS dates.

Approvals are configurable. Any document type can be routed through a multi-level approval chain without programming — see chapter 2.

Invoices go to IRD automatically. When you submit a Sales Invoice it is reported to the IRD CBMS system in the background. You never wait for it, and a synced invoice can no longer be cancelled — corrections go through a Sales Return.

Attendance comes from fingerprint devices. Punches flow from the devices (via the K40 Bridge or direct push) into Employee Checkins and then daily Attendance, automatically flagged for lateness and holidays.

Signing in

- Desk (staff): `http://<your-server>/app`
- Customer portal: `/customer_statement`, `/product_wise_invoice_details`, `/place_order` (requires a portal login with the Customer role)
- Supplier RFQ portal: link received by email

Getting help

If a document refuses to save, read the error message carefully — most messages in this system are specific ("Row #2: Vehicle is mandatory...", "Company Mismatch...", "Only may make changes...") and this guide's chapters explain each one. When in doubt, contact your System Manager.

Approvals — User Guide

The Dynamic Approval System routes documents (Purchase Orders, Material Requests, Leave Applications, ...) through a chain of approvers before they are submitted. This chapter explains what you see and do; setup is in [chapter 8](#).

How an approval flows

1. **You create the document** as usual. If it is under approval control, you will see an **Approval Hierarchy** table on the form.
2. **Add your approvers** (if your document type lets you choose them): each row is one level — Level 1 is approved first, then Level 2, and so on. Management may have configured additional *fixed approvers* that are automatically appended after your levels; you don't need to add those.
3. **Submit for Approval.** The document moves to *Pending Approval* and the Level-1 approver gets an email.
4. **Each approver approves in turn.** The document stays in *Pending Approval* until the last level approves — then it becomes *Approved* and is submitted.
5. If any approver **rejects**, the document becomes *Rejected* and is editable again. Fix it and submit again from the start.

What you see on the form

- A **progress banner** at the top: ✓ Level 1 → ✕ Level 2 (current) → ○ Level 3, plus a line telling you whose turn it is — "Your approval is required at Level 2" or "Waiting for at Level 2".
- While the document is pending and it is **not your turn**, the form is read-only and the Approve/Reject buttons are hidden. Only the current approver can act or edit.
- Hierarchy rows that are already approved are **locked** — you cannot edit or delete them.
- An **Approval History** table records every step (created, submitted, approved at each level, rejected) with user and timestamp.

Approving and rejecting

- **Approve:** open the document, use the workflow action button (top right) → *Approve*. If you are an intermediate level, the document stays pending and moves to the next approver; if you are the last level, it is submitted.
- **Reject:** choosing *Reject* opens a mandatory **Reason for Rejection** box. The reason is saved on the document (or as a comment) so there is always an audit trail. You cannot reject without a reason.

Emails

The next approver is emailed at every step. Rejection sends a distinct email to the requester.

Common questions

Why did my document get approved instantly?

No approval rule matched it (for example, its company or category has no active rule). It is auto-approved with a history entry "Auto-approved (no matching approval rule)". If that's wrong, ask your admin to check the Dynamic Approval Setting.

Why can't I edit a pending document?

Only the current approver may change a pending document. You'll see "Only may make changes". Wait for the flow to finish, or ask the current approver to reject it back to you.

Can I skip a level?

No — even the Administrator advances one level at a time.

The document was rejected — now what?

It is back in an editable state. Make the correction and submit for approval again; the chain restarts from Level 1.

Who chooses the approvers?

Depends on the rule: your own hierarchy rows (Levels 1..N) are yours to fill; fixed approvers configured by management are appended automatically after

them.

Attendance & HR — User Guide

For HR Managers and HR Users. Covers how fingerprint punches become attendance, how to fix gaps, allowances, and the HR reports.

1. How attendance works (the happy path)

1. An employee punches on the fingerprint device (ZKTeco K40, Hikvision, or an HTMS-connected controller).
2. The **K40 Bridge** (a small Windows program at each site) — or the device itself, if it pushes directly — sends the punches to ERPNext.
3. Each punch becomes an **Employee Checkin**. Punches alternate IN → OUT → IN for the day, sorted by time. Re-sent punches are ignored (no duplicates), and a punch that arrives late slots into the right place automatically.
4. The Shift Type's auto-attendance job turns the day's checkins into a submitted **Attendance** record.
5. On the Attendance, the system automatically fills:
 - **Late entry / early exit minutes** (compared to the shift times),
 - **Half Day** if the first punch is after the shift's late-arrival cutoff

(with leave type "Leave Without Pay"),

 - **Worked on Holiday** if the date is in the employee's holiday list.

On the Attendance form you can see the day's **Checkin Log** (IN in green, OUT in orange) right below the status.

Employee setup that must be right

- Every employee needs their **Attendance Device ID** set to the user ID they have *on the device* (for HTMS: the Emp No, with leading zeros exactly as stored).
- The same device ID may be reused **across companies** but must be unique **within** a company — the form blocks duplicates.
- The employee's Company must match the device's Company (a punch on Company A's device only matches Company A's employees).

2. Fixing attendance (Attendance Fix)

When a bridge PC was off, a device was offline, or attendance is otherwise wrong for a period, use **Attendance Fix**:

1. New Attendance Fix → choose the **Shift Type** and the **From/To dates**. Optionally narrow to one **Employee**, one **Company**, or specific **Devices**.
2. **Submit**. The job runs in the background; the form shows a live progress bar and refreshes itself.
3. When it finishes you get counters (attendance created/updated, checkins relinked, stale Absent rows deleted) and a day-by-day log.

What it does per employee/day: creates attendance from checkins where missing; replaces a wrong "Absent" with the real attendance when checkins exist; links orphan checkins to existing attendance; marks Absent where there are no checkins (skipping holidays); and never touches days that already look right.

Tip: when a bridge comes back online after an outage, the recovery email you receive tells you the date range to run Attendance Fix for.

3. Devices, syncing and alerts

- Each physical device is a **Biometric Device** record: name, serial number (must match the real hardware serial), Company, and enabled flag. Punches from unknown or disabled serials are rejected.
- **Force Bridge Sync**: on the Biometric Device form, this button asks the bridge to sync that device now; the result appears within a minute or two.
- **Alerts**: add emails to the device's *Alert Recipients* table and set the threshold (default 120 minutes). If the bridge stops reporting for longer than the threshold, those people get one "down" email, and one "recovered" email when it returns.
- The bridge itself is installed from `K40BridgeSetup.exe` on a Windows PC on the device's network — see the install runbook (`k40_bridge/SETUP.md`) or ask your administrator.

4. Attendance allowances (payroll)

Allowances that depend on attendance (meal allowance, tea/conveyance, holiday work, overtime-style rules) are computed from Attendance records:

- Each allowance is a **Salary Component** marked *attendance driven*, with a condition (Present / Half Day / Worked on Holiday / Late Stay After / Early Entry Before / Late Arrival After / Working Hours threshold), a unit (per day / per hour / flat per period), and a default rate.
- Per-employee overrides live on the Employee form in the **Attendance Allowances** table (set a different rate, or untick *Eligible* to exclude the employee). Overtime-type rules also require the employee's **OT Eligibility** checkbox.
- On a **Payroll Entry**, click **Calculate Attendance Allowances** (under the Nepal HRMS menu). This creates/updates draft **Additional Salary** records — one per employee per component — and reports what was created or skipped. You can run it again safely; it replaces its own previous drafts.

5. HR reports (all in Nepali BS months)

Report	Use it for
Monthly Attendance BS	the day-by-day register for a BS month: in/out times, hours, late minutes, status, holiday work, and a column per attendance allowance
Monthly Attendance Summary BS	one line per employee for the month — present days, OT hours, late time, meal/tea groups, leave this month / last month / year-to-date. Mirrors the physical muster sheet
Work On Holiday BS	who worked on holidays, month by month across the fiscal year
Yearly Leave Details BS	leave taken per BS month, total allocation, and remaining balance per employee
Avinas Salary Statement	the salary sheet for a BS month: all earnings and deductions in columns, grouped by designation with sub-totals, plus last month's net for comparison

Pick the fiscal year / BS month in the filters; you can also switch to an AD date range where offered.

Buying, Selling, VAT & Vouchers — User Guide

For accounts, purchase and sales staff. Covers the custom tax fields on every buying/selling document, warehouses, voucher numbers, vehicles, credit terms, and cheque bounce.

1. VAT on every line — the "Apply On" selector

Every item row on Purchase Invoice / Order / Receipt / Supplier Quotation and Sales Invoice / Quotation / Sales Order / Delivery Note has:

Field	What to do
VAT Apply On	VAT 13% (default — VAT is calculated for you), VAT 0% (tax-free line), or Amount (you type the VAT amount yourself)
Excise Value	type the excise duty for the line if any — it is never auto-calculated
Total	shown automatically = line amount + excise. VAT is charged on this
VAT Amount	calculated (read-only) except in Amount mode

The system automatically writes the matching **Excise Duty** and **VAT** rows into the taxes table and recalculates the grand total — don't add those tax rows by hand.

Returns: on a Purchase/Sales Return, quantities and VAT are automatically made negative — just enter positive numbers as usual.

2. TDS on Purchase Invoices

1. Pick the **Tax Withholding Category** in the invoice's custom TDS field (this is separate from ERPNext's standard TDS field — use the custom one).
2. Tick **Apply TDS** on the item rows it applies to.
3. Per row choose **Percentage (%)** (rate comes from the category) or **Amount** (type it). The TDS total is deducted in the taxes table automatically and, on submit, the TDS ledger entry is tagged with the supplier so the TDS ledger reconciles per party.

3. Warehouses pick themselves

Items can have different warehouses per **branch** (and buying vs selling). The mapping lives on the Item (*Branch Wise Warehouse* table, with item-level defaults as fallback). When you pick an item on a document, the correct branch warehouse is filled in automatically. If you choose a warehouse manually and no mapping exists, your choice is kept.

4. Voucher numbers

- Document names are generated as {company}-{prefix}-{fiscal year}-{number} (e.g. a Sales Invoice NGK-SB-82/83-0000123 ; returns get their own prefix).
- Some documents also carry a human **Voucher No** (`custom_name` , e.g. SGU-RC-000006-82/83) built from the company, type code, document number and fiscal year.
- For certain types (Other Purchase Receipts, Purchase Returns, Bank/Journal voucher types, bank receipts), the **Document No** field fills itself with the next number when you open a new form. If you type a number yourself, it is kept — the letter suffix ("65" vs "65A") distinguishes duplicates.
- Duplicate voucher numbers are blocked (cancelled documents excluded, so an amended document reuses its number).

5. Vehicles on expense lines

Any Purchase Invoice item or Journal Entry line booked to a vehicle expense account (**Fuel Expenses, R & M - Vehicles, Other Vehicle Expenses**) must have a **Vehicle** selected. The dropdown only offers the vehicles configured on that account (Account → Vehicle List). If you get "Row #N: Vehicle is mandatory...", pick the vehicle; if the dropdown is empty, ask your admin to configure the account's vehicle list. These expenses feed the Vehicle Expense report.

6. Master-data helpers

- **Duplicate warning:** saving a Customer/Supplier whose name or VAT/PAN already exists in the same company asks "Do you want to create it again?" —

choose No and use the existing record (its ID is a clickable link).

- **Default accounts row:** Customers, Suppliers and Items automatically get one default accounting row with the right Company filled in.
- **Company is locked after saving** — you cannot change a record's company once created (the number series embeds the company). Create a new record instead.
- **Company Mismatch errors** mean you picked a record belonging to a different company — the dropdowns filter for you, but pasted values are checked on save.

7. Customer credit & due dates

- The invoice **due date** fills automatically from the customer's payment-day terms (Customer → days limit); supplier invoices likewise from the supplier's payment term days.
- Credit-limit blocking (bill count / overdue days / amount) exists in the system but is **currently not active** — ask your administrator about its status before relying on it.

8. Cheque bounce

If a customer's cheque bounces after you submitted the Payment Entry: open the submitted Payment Entry → **Actions** → **Cheque Bounce** → confirm. The system posts a reversing ledger entry (the invoice becomes outstanding again) and marks the Payment Entry "Cheque Bounced" in red. The original entry is *not* cancelled — the reversal sits alongside it, which keeps the audit trail intact.

9. Stock Adjustment (quantity-only correction)

For pure quantity corrections (found/lost cylinders etc.) use **Stock Adjustment**: date, company, Loss/Gain, reason, and item rows with warehouse and quantity. **Rate must stay 0** — if value must move, use a Stock Entry instead. On submit the stock quantity changes but the stock *value* is preserved, and this survives later revaluations.

Backdated purchase invoices that update stock show an orange notice that valuation will be reposted overnight — that is informational, not an error.

10. Invoice print copies (IRD rule)

The system counts how many times each Sales Invoice is actually printed or downloaded as PDF and labels the output accordingly, as IRD requires:

- **1st print** → *Tax Invoice*
- **2nd print** → *Copy of Original*
- **3rd print** → *Copy of Original 2*, and so on.

Only a real print or PDF download counts — opening the Print **preview** does not use up a copy number (the preview shows the title the next print will carry). You don't do anything for this; it is automatic.

11. Portals

- **/place_order** — customers order LP Gas online; orders arrive as submitted Sales Orders.
- **/rfq/** — suppliers answer a Request for Quotation online, including VAT, discounts and attachments; a Supplier Quotation is created automatically.
- Customer statement and product-wise invoice portals: see [chapter 7](#).

CBMS / IRD e-Billing — User Guide

For accounts staff. CBMS is the IRD's Central Billing Monitoring System — every sales invoice must be reported to it. In this system that happens **automatically**; this chapter tells you what to watch and what to do when something needs attention.

What happens automatically

- When you **submit a Sales Invoice**, a **CBMS Bill** record is created and sent to IRD in the background. You never wait for it — submission is never blocked by CBMS.
- When you submit a **Sales Return** (credit note), a **CBMS Bill Return** is created and sent — after the original invoice's bill has reached IRD (the system enforces the order for you).
- Every 5 minutes the system automatically **retries failures** and **catches any invoice that was missed**. You normally don't need to do anything.

The one field you fill in

On a **Sales Return**, fill **Reason for Return** — it is reported to IRD. If you leave it blank, "Goods Returned" is sent.

Monitoring

Open the **CBMS Bill** (and **CBMS Bill Return**) list and filter by **Sync Status**:

Status	Meaning
Synced	reported to IRD — done
Pending	queued; will be sent within minutes
Failed	IRD rejected it — open the record and read Sync Response

Each record shows the attempt count, last attempt time, and IRD's last response message. All fields are read-only — you never edit CBMS records.

Fixing failures

Sync Response	What to do
100: API credentials do not match	the IRD username/password in CBMS Config is wrong — fix it there; the retry job re-sends automatically
Return stuck Pending	its original invoice's CBMS Bill isn't Synced yet — resolve the original first; the return recovers by itself
104: Model invalid	something in the invoice data was rejected (e.g. bad PAN) — check the customer's tax id and the invoice values, then ask your admin
An invoice has no CBMS Bill at all	the catch-up job creates it within 5 minutes; if it still doesn't appear, ask your admin to check the Error Log

There is no button for an instant retry — the system retries every 5 minutes on its own. An administrator can trigger an immediate retry from the bench console if ever needed.

Cancelling invoices

A synced invoice cannot be cancelled — you'll get an error saying it has already been reported to IRD. This is by design: corrections must be made with a **Sales Return** (credit note), which is itself reported to IRD. Invoices that are still Pending/Failed (not yet at IRD) can be cancelled normally.

Setup (admin, once per company)

Create one **CBMS Config** per company: tick *Enable CBMS Sync*, set the go-live **Enable From Date** (invoices dated before it are never sent), and enter the company's IRD **Username/Password**. There is no test mode — the config talks to the real IRD system, so only enable it when the credentials are the production ones.

Document Generator — User Guide

For accounts and admin staff. The Document Generator produces formal letters — today mainly the **Customer / Vendor Balance Confirmation** letters — from ready-made templates, filled with live data, editable before printing or emailing.

You need one of these roles: *Document Template User* (generate documents), *Document Template Manager* (also author templates), or System Manager.

Generating a letter

1. Open the **Document Generator** page (search "Document Generator" in the awesomebar).
2. **Choose a template** — e.g. *Customer Balance Confirmation*.
3. **Choose the company** the letter is from.
4. **Fill the inputs.** For the balance-confirmation letters:
 - the **Customer** (or Vendor) — the dropdown only shows parties of the chosen company;
 - **either** a **Fiscal Year** or a **From/To date range** — they are mutually exclusive; filling one clears the other. Every date field has a paired Nepali (BS) picker that stays in sync.
5. The letter **builds itself** as soon as the inputs are complete — there is no Generate button. The rendered letter appears in an editable page.
6. **Edit if needed** — the letter is directly editable (bold, lists, alignment, even inserting an image from the toolbar).
7. From the **Actions** menu choose:
 - **Print (letterhead paper)** — the PDF leaves the letterhead area blank, for printing on pre-printed company paper;
 - **Print (with letterhead)** — the PDF includes the drawn header/footer (logo, company name, VAT no, contacts) — use this for digital copies;
 - **Email** — enter recipients (or leave blank to use the party's email on file); the letter is emailed as a PDF.

Every print or email automatically saves a **Generated Document** record — your archive copy, with the exact inputs used, the final text, and the email status. Open one later and click **Edit in Generator** to revise and re-issue it.

What the balance-confirmation letters contain

A dated (BS) letter addressed to the party, showing for the period: opening balance, taxable sales/purchases, VAT @13%, (TDS for vendors), total, and closing balance — followed by a request to confirm within 7 days and a signature block with your signature image, name, designation and the company stamp.

For your signature and the stamp to appear, the admin must have set up: your Employee record's *signature image* and *Document User* link, and the Company's *document stamp image* ([chapter 8](#)).

Authoring or changing templates (managers)

Templates are **Document Template** records (name, target companies, inputs, data sources, letter body in HTML, header/footer, email subject). Saving validates the template; the **Preview** button renders it with sample data. Authoring is a semi-technical task (HTML + query writing) — the full authoring guide is in the technical documentation:

[../technical/07-document-generator.md](#)

\$7.

Reports — User Guide

Every custom report, grouped by who uses it. Open any report from the awesomebar by name. General tips:

- **Company** filters accept multiple companies where shown as a multi-select.
- **Dates**: reports with date filters usually show a Nepali (BS) "Miti" twin and a **Select Month** button — pick a BS month and both dates fill themselves.
- **Printing**: most reports have their own **Download PDF** / Print buttons that produce a properly paginated PDF (with page numbers); some ask Portrait/Landscape first. "Fit Columns" is a screen-view toggle and doesn't affect the print.

For accountants — compliance (IRD)

Report	What it gives you
Sales Register	the VAT sales register: one row per invoice, values split into tax-free / export / taxable / VAT — ready for the VAT return. Returns mode shows credit notes
Purchase Register	the VAT purchase register: tax-free / taxable / import / capitalized buckets with their VAT amounts and quantity
Advance Tax TDS Details	the TDS (अग्रिम कर) withholding statement per supplier and category, in IRD format with Nepali headers; print includes the Prepared/Checked/Verified signature block
One Lakh Above Transactions	all customers & suppliers whose taxable or exempt turnover in the period is NPR 100,000 or more — the IRD annexure

For accountants — ledgers & cash

Report	What it gives you
Party Ledger	a full statement for one party (or grouped statements for many): opening balance, every voucher with running balance, closing. BS Miti dates, remarks, optional item-level detail. This is also what customers see on their portal
Party Ledger Summary	one line per party: opening / debit / credit / closing. "Super Summary" (flat) or "Group Wise" (per customer/supplier group). Excel export shows Dr/Cr columns
Receipt Register	customer receipts in three layouts: by date, by customer, or one line per customer
Net Position of Cash and Bank	every cash/bank account's opening, receipts, payments and closing for the period
Loan Summary	short- and long-term borrowings per loan type across companies, with a ratio row; "Show Details" expands sub-accounts. Balances are cumulative up to the To Date

For management

Report	What it gives you
Consolidated Financial Statement Hierarchy	Balance Sheet / P&L / Cash Flow consolidated across any set of group companies, with a Total column and a depth control to collapse the account tree
Profit and Loss Hierarchy	a single company P&L collapsed to the account level you choose (1-6)
Sales Analysis — Customer wise Summary	per-customer quantity and value, with optional returns and net columns
Sales Analysis — Customer wise Details	customer → product drill-down with VAT and totals
Sales Analysis — Product wise Invoice Details	product → customer → individual invoices and returns, with product and grand totals
Avinas Vehicle Expense	per-vehicle Fuel / Repair / Others expense totals (from purchase invoices and journal entries) for a fiscal year or date range
Custom Supplier Quotation Comparison	items as rows, suppliers as columns — compare quoted prices, discounts, VAT and invoice totals side by side and pick a default supplier
Gas Purchase Report	the LPG procurement register per store receipt: refinery, tanker, IOC challan, quantity, rate, VAT, ICP/NA service charges, totals — filtered by BS month
Sales Stock Ledger	stock movement driven by sales invoices, detail or summarized, with BS dates and an optional sales/returns merge

For HR

See [chapter 3 §5](#):

Monthly Attendance BS, Monthly Attendance Summary BS, Work On Holiday BS, Yearly Leave Details BS, Avinas Salary Statement.

For auditors / System Managers

Report	What it gives you
User Audit Trail	everything one user created or changed in a date range — per field, old value → new value, including child-table rows. Pick the user, dates, optionally document types
User Daily Entry Summary	how many documents a user created on a given day, by type and status (draft/submitted/cancelled); every count is a click-through to the underlying list

Customer portals

Customers with a portal login (Customer role) can self-serve:

Page	What the customer sees
/customer_statement	their own account statement (same data as Party Ledger), with AD + BS date pickers and a PDF download. Deposit/security accounts are excluded automatically
/product_wise_invoice_details	their own product-wise invoice details, including returns
/place_order	place an LP Gas order online (cylinder sizes, live rates, VAT); it arrives as a Sales Order

Customers only ever see their own companies and accounts — every request is re-checked on the server.

Administrator Setup — User Guide

For System Managers. Every feature's setup checklist in one place. Console commands run via `bench --site avinas1 console` (or `bench --site avinas1 execute <dotted.path>`).

1. Dynamic Approvals

1. **Dynamic Approval Setting** → New: pick the **Document Type** and **Company**; keep the default fieldnames.
2. In the **rule cards** area, *Add Section*: give it a name, add **criteria** (field = value pairs — ALL must match; the rule with the most matching criteria wins) and the ordered **fixed approvers**.
△ A section with *no* criteria matches nothing — for a catch-all rule add one always-true criterion (e.g. `company = that company`).
3. Click **Setup Workflow** (button, System Manager only). This injects the approval fields onto the document type and creates/updates the "Approval Workflow" (Draft → Pending Approval → Approved / Rejected).
4. Documents with **no matching rule auto-approve** — verify your criteria cover what you intend.
5. After changing the engine or Setting fields, rebuild all workflows:

```
from avinashgroup_app.custom_code import update_workflows; update_workflows.run()
```
6. Rejection reasons are stored in the document's `custom_reason` field if it exists (e.g. Purchase Order), otherwise as a comment.
7. Only the literal **Administrator** account bypasses approver checks (one level at a time); System Managers do not.

2. Biometric devices & the bridge

1. Per device: **Biometric Device** → New — name, **hardware serial** (must match exactly; unknown serials are rejected), **Company**, enabled.
2. Per employee: set **Attendance Device ID** (unique within the company), correct Company, and a Shift Assignment. Shift Types need their Company set and auto-attendance enabled.
3. Bridge PC (per site): install `K40BridgeSetup.exe` on an always-on Windows machine on the device LAN. In the wizard: ERPNext URL + an **API key/secret** for a bridge user (needs Employee Checkin create, Biometric Device read/write, Employee read), then one row per device (name, type, IP/port or HTMS folder, serial, company). Test Connection → Save & Start.
4. Verify: tap a finger, check the Employee Checkin list.
5. Alerts: fill **Alert Recipients** + threshold on each device.
6. Optional Shift Type extras: `custom_late_arrival_cutoff_time` enables the automatic Half-Day rule.

3. Attendance allowances

1. Mark each allowance **Salary Component**: *attendance driven*, condition type, unit, default rate, optional summary group (groups columns in the summary report).
2. Employee overrides: Employee → **Attendance Allowances** table; OT-type rules also need the employee's **OT Eligibility** checkbox.
3. HR runs **Calculate Attendance Allowances** on each Payroll Entry.

4. CBMS (IRD e-billing)

One **CBMS Config** per company: Enable + **Enable From Date** + IRD username/password. No test mode — production endpoints only. Monitor the CBMS Bill list; errors are in each record's Sync Response and in the Error Log. Immediate manual retry (rarely needed):

```
frappe.get_doc("CBMS Config", "<company>").sync_failed_now("<company>").
```

5. Fiscal-year access control

- **Default is full access.** A user is restricted only once a **Fiscal Year Access Control** record exists for them: either *Full Access*, or rows of (Document Type → specific Fiscal Year / all years).
- Administrator and anyone with **System Manager** always bypass.
- It restricts *seeing* (lists, reports, direct opens, API) — it does **not** block saving a document dated outside the range.

- Changes take effect on the user's next request.

6. Company filtering

- **Company Filter Config** (one per doctype) + **Company Filter Field** rows define which Link fields are filtered to the document's company (plain, child-table, or dynamic-link fields).
- Saving clears the server cache; users must **refresh their browser** to pick up config changes.
- Server-side "Company Mismatch" validation runs on save for all audited doctypes regardless of the JS.

7. Audit fields, numbering & company lock

- Audit fields (created by/on, modified by, company, naming series) are stamped automatically on ~85 doctypes. Manage per doctype from the console — **always pass an explicit list** (no argument = all ~85 doctypes):

```
from avinashgroup_app.utils.audit_file_manager import AuditFieldsManager, update_custom_company_reqd
AuditFieldsManager(["Item Price"]).create_fields()
AuditFieldsManager(["Item Price"]).verify_fields()
AuditFieldsManager(["Item Price"]).remove_fields()
update_custom_company_reqd()
```

- Voucher zero-pad width per doctype: **Voucher Number Settings** (child rows: doctype → digits, default 6).
- Company-field lock (read-only after first save) — runtime block is always on; to also grey the field in the UI:

```
from avinashgroup_app.custom_code.Override import setup_company_lock
setup_company_lock.quick_setup(); setup_company_lock.verify_setup()
```

- Track-changes for the audit trail and the (owner, creation) / GL-aggregation indexes are installed by `bench --site avinas1 migrate`.

8. User Daily Entry Summary

User Daily Entry Summary Settings (single) → add the doctypes to track (keep the list short — one query each per report run), then `migrate` to build the indexes.

9. Document Generator

1. Roles come from migrate: *Document Template Manager* (authors), *Document Template User* (generates own documents only).
2. One-time assets: Company → **Document Stamp** image; Employee → **Signature Image** and **Document User** (link to the User who signs — deliberately separate from the employee's login user).
3. The two balance-confirmation templates ship as fixtures; new templates are authored per the technical guide (`../technical/07-document-generator.md` §7).

10. Housekeeping & diagnostics

Task	Command
Stock health check (negative stock, zero-valuation sales, repost queue)	<code>bench --site avinas1 execute avinashgroup_app.custom_code.stock_health_check.run</code>
Restart failed valuation reposts	<code>console → avinashgroup_app.custom_code.stock_revaluation.reprocess_all_pending()</code>
Export all custom fields to Excel	<code>console → avinashgroup_app.utils.export_field.export_custom_fields_to_excel()</code>
Pad voucher numbers to 6 digits (dry run)	<code>console → avinashgroup_app.scripts.pad_custom_name.run(dry_run=1)</code>
Remove audit/naming fields from a doctype	<code>avinashgroup_app.scripts.cleanup_audit_fields.run(["<DocType>"])</code>
DB replication runbook	<code>docs/db-master-slave-replication.md</code>

11. Deployment reminders

- After editing client JS: bump its `?v=` in `hooks.py`, `bench build`, restart, and have users hard-refresh.
- After Python changes on live: `bench restart`.
- `bench --site avinas1 migrate` after pulling — patches are idempotent.
- The dev server can mask real errors behind a 500 `BrokenPipeError` page — check the console/logs, not the HTTP response.
