

Document Numbering System — How It Works

File: [avinashgroup_app/custom_code/Override/naming_series.py](#) | Avinash Group ERPNext | Non-developer guide

This is the engine that builds the ID / name of almost every document in the system (Sales Invoices, Purchase Orders, Items, Customers, etc.). It replaces ERPNext's default numbering so that every document gets a **company-aware, fiscal-year-aware, branch-aware** number automatically.

The two names every document gets

When you save a document, the system can stamp up to **two** identifiers:

Field	Example	Purpose
Document ID (<code>name</code>)	GEPL-SB-82/83-00015	The unique technical ID Frappe uses everywhere
Custom Name (<code>custom_name</code>)	GEPL-PB-000065A-82/83	A business-friendly voucher number printed on documents
Branch Name (<code>custom_branch_name</code>)	GEPL-INV-000123-82/83	A separate per-branch running number (only for some documents)

How a number is built

Each document type has a recipe (a **prefix** + rules). The general shape is:

```
[Company]-[Prefix]-[Fiscal Year]-[Running Number]
```

- **Company** — taken from the document's Company field (uses the company's short abbreviation, e.g. `GEPL`).
- **Prefix** — a short code per document type (Sales Order = `SO` , Purchase Order = `PO` , Item = `ITEM` , etc.).
- **Fiscal Year** — added only for "transaction" documents (invoices, orders, payments). Master data (Customer, Item, Vehicle) does **not** get a fiscal year.
- **Running Number** — an auto-incrementing counter (e.g. `00015`), 3 or 5 digits depending on the type.

Returns get a different prefix. A Sales Invoice is `SB` , but a Sales **Return** becomes `SRTN` . Same for Purchase Invoice (`PI` → `PRTN`).

Amendments keep the original number with a `-1` , `-2` suffix added.

Special behaviors

1. **Branch-wise numbering** — For company **Grishma Enterprises Pvt. Ltd.** only, Sales Invoices, Purchase Receipts and Purchase Invoices get an *extra* branch number. Each branch has its own code (e.g. Branch 1 = `INV` , Branch 2 = `SB`), and returns from a branch use a different code (`RT` , `BSR` , etc.).
2. **Manual voucher numbers** — For some documents (Purchase Invoice, Journal Entry, Payment Entry), the user types a document number and an optional letter ("word"). So `65` and `65A` are treated as two **different** vouchers. The system checks these are never duplicated.
3. **Auto-suggested numbers** — For a few specific transaction types (e.g. *Purchase Return, Bank Customers Receipt, Debit/Credit Note*), the system automatically suggests the next available number instead of making the user guess.
4. **Duplicate protection** — Before saving, it blocks any document whose business voucher number already exists, showing "*Document number X already exists.*"
5. **Number reuse on delete** — If you delete the most recently created document in a series, the counter steps back by one so the number isn't wasted (matching standard ERPNext behaviour). Gaps in the middle are left alone.
6. **One company is excluded** — Documents for **Grihalaxmi Metal Industries Pvt. Ltd** get a blank custom name (they use a different scheme).

Validation / guard rails

When you save, the system will **stop you with an error** if:

- The Company field is empty (it can't build a company-prefixed number), or
- A transaction document has no date / no matching Fiscal Year set up.

Exactly where it works (which doctypes)

The numbering logic only runs for doctypes that are **both** listed in the config **and** registered for the events. Registration happens in `avinashgroup_app/utils/audit_file_manager.py` (the `AuditBase.doctypes` list), which attaches the `validate` , `before_insert` , `before_save` , `autoname` and `after_delete` handlers. The number recipe per doctype lives in `NAMING_CONFIG` inside `naming_series.py` .

Transaction documents (get Company + Fiscal Year + number)

Sales Order	Sales Invoice	Delivery Note	Quotation	Purchase Order	Purchase Receipt	Purchase Invoice	Material Request	Stock Entry
Material Transfer / Issue / Receipt	Stock Reconciliation	Stock Reservation Entry	Pick List	Packing Slip	Payment Entry	Payment Request	Payment Order	
Bank Transaction	Journal Entry	Landed Cost Voucher	Expense Claim	Employee Advance	Work Order	Job Card	Leave Application	Leave Allocation
Attendance	Payroll Entry	Salary Slip	Asset Movement	Asset Repair	Asset Capitalization	Project Update	Maintenance Visit	Warranty Claim
Job Applicant	Job Offer	Appointment Letter	Issue	Timesheet	Subscription / Invoice	POS Opening / Closing / Invoice	Sales Partner	Interview
Interview Feedback	Training Event	Opportunity	Communication	BOM Update Tool	Request for Quotation	Supplier Quotation	Project	Task
Serial No	Batch							

Master data (get Company + number, no fiscal year)

Item	Item Group	Item Price	Price List	Customer	Customer Group	Supplier	Supplier Group	Employee	Address	Contact	BOM
Salary Structure	Vehicle	Vehicle Log	Holiday List	Branch	Operation	Workstation	Routing	Asset	Asset Category	Asset Maintenance Team	
Asset Value Adjustment	Expense Claim Type	Mode of Payment	Bank Account	Payment Term	Designation	Shift Type	Lead	Prospect	Manufacturer		

The three special cases

- **Branch numbering** applies only to: **Sales Invoice, Purchase Receipt, Purchase Invoice** (and only for *Grishma Enterprises Pvt. Ltd.*).
- **Manual + custom voucher number** applies to: **Sales Invoice, Purchase Order, Purchase Receipt, Purchase Invoice, Material Request, Payment Entry, Journal Entry** (the ones flagged `has_custom_name`).
- **Auto-suggested next number** applies to specific *types* within: **Purchase Receipt** (Other Purchase Receipt), **Purchase Invoice** (Purchase Return), **Payment Entry** (Bank Customers Receipt, NOC Payment, Contra Voucher), **Journal Entry** (Bank Entry, Party Journal, Debit Note, Credit Note).

Note: `Leave Type` and `BOM Template` appear in the file but are commented out — they are **not** active.
